

Aarsleff Ground Engineering

Drilling & Grouting

Drilling & Grouting

Aarsleff Ground Engineering have the specialist plant and labour to carry out all types of drilling and grouting works, from the filling of redundant coal mines and soil mixing to stabilisation and compaction grouting. Grouting can prevent against collapse of redundant voids associated with mine working tunnels, sewers, sinkholes and culverts.

- ✓ Drilling and Grouting can be performed in limited working space
- ✓ Value engineered solutions
- ✓ Aarsleff has the ability to manoeuvre and grout around existing structures to consolidate soil in existing commercial or residential areas
- ✓ Variety of drilling systems and flush mediums to best accommodate job requirements

Drilling & Grouting is used to improve the existing soil formation by changing the soil properties. It can increase the bearing capacity or provide settlement control for new construction, or to remedy an existing issue. Drilling & Grouting does not create structural elements to 'bridge' unsuitable soil layers but rather improves the ground itself to allow for shallow foundations.
