*Mini Piling*

# Mini Piling

Aarsleff Ground Engineering can install various mini piling techniques. The decision of which to use is taken on a job-by-job basis. Mini piling is often carried out in a confined space, since the equipment is significantly smaller than what's required for traditional piling. It's also good for built-up areas, since it causes less noise and vibrations, while still producing secure foundations.

- ✓ Mini piles are the ideal solution for sites with low headroom or restricted access
- ✓ Can be used for small house extensions and detached plots
- ✓ Cost-effective method for use on difficult underpinning projects
- ✓ Generates limited noise and fumes and are therefore ideal for projects when environmental issues are a concern
